14. ABSTRACT This report summarizes information from 24 U.S. Navy-funded aerial surveys of pinniped haulout sites in the inland waters of Washington State conducted between March 2013 and February 2014 by Washington Department of Fish and Wildlife. These aerial surveys represent the first pinniped assessments to be performed in the region of activity over all four seasons and provide much needed information about seasonal variation of harbor seal (<i>Phoca vitulina</i>), California sea lion (<i>Zalophus californianus</i>) and Steller sea lion (<i>Eumetopias jubatus</i>) distribution and abundance in this area. Marine mammal species recorded during aerial surveys included harbor seal, northern elephant seal (<i>Mirounga angustirostris</i>), Steller sea lion, California sea lion, gray whale (<i>Eschrichtius robustus</i>), and killer whale (<i>Orcinus orca</i>). Harbor seals are the most abundant pinniped and present year-round in the study area. Maximum counts of harbor seals occurred during July and August aerial surveys. The harbor seal population in inland waters of Washington was estimated at 14,980 seals in July and 15,802 in August 2013. These estimates coincide with the annual pupping and molt cycles for harbor seals in the inland waters of Washington when maximum numbers of seals are expected to be hauled out. During fall, winter and spring surveys, counts of seals on haulout site were substantially lower, with the majority of the harbor seal population not hauling out and in the water. The highest abundance of harbor seals at Navy facilities was recorded on logbooms adjacent to NAVSTA Everett. Steller sea lions are present in the study area year round with maximum counts recorded at Navy facilities during November aerial surveys when 30 and 32 Steller sea lions were hauled on floats in Clam Bay adjacent to the Navy's Manchester Fuel Depot. Only a small number of Steller sea lions (1-3 animals) were recorded using the port security barriers at NBK Bremerton and NAVSTA Everett. Craven Rock on the east side of Marrowstone Island was another haulout used consistently during aerial survey windows. No Steller		

sea lions were observed using the port security barriers at NAVMAG Indian Island. California sea lions are present in the study area year round with maximum counts recorded at Navy facilities during November aerial surveys. Aerial survey counts at NBK Bremerton ranged from 2 to 169 animals, with maximum counts of 169 animals (6 November 2013) and 164 animals (8 November 2013) recorded hauled out on port security barriers. Aerial survey counts at NAVSTA Everett ranged from 3 to 131 animals, with maximum counts of 117 animals (6 November 2013) and 131 animals (8 November 2013) recorded hauled out on port security barriers. No California sea lions were observed using the port security barriers at NAVMAG Indian Island.

1. Introduction

The Washington Department of Fish and Wildlife (WDFW) conducted United States (U.S.) Navy-funded aerial surveys of pinniped haulout sites in the inland waters of Washington State. Aerial surveys conducted under this Task Order (TO) represent the first pinniped assessments to be performed in the region of activity (**Figure 1**) over all four seasons, and therefore, will provide much needed information about seasonal variation of harbor seal (*Phoca vitulina*), California sea lion (*Zalophus californianus*) and Steller sea lion (*Eumetopias jubatus*) distribution and abundance in the inland waters of Washington State.

Objectives of this TO were to conduct aerial surveys of the waters from the Strait of Juan de Fuca to Puget Sound (**Figure 1**) in order to 1) provide estimates of seasonal abundance for seals and sea lions; 2) identify seasonal distribution patterns for seals and sea lions; 3) collect data to determine seal and sea lion densities; and 4) provide harbor seal abundance data needed by National Marine Fisheries Service (NMFS) to prepare a Stock Assessment Report (SAR) for the Washington Inland Waters Stock of harbor seal. Additionally, in 2000 the WDFW published an atlas depicting pinniped haulouts for these waters (Jeffries et al. 2000), which has not been updated in 13 years, and this atlas will be revised as part of this TO.

The NMFS Northwest Region (NMFS NWR) has partially funded the current effort by supporting summer-only aerial surveys covering U.S. waters of the Strait of Juan de Fuca (Cape Flattery to Port Angeles) as well as the San Juan Islands. This collaborative approach between the U.S. Navy and NMFS will allow NMFS to update the SAR for the Pacific harbor seal (Washington Inland Waters Stock). The current SAR is derived from population estimates from 1999, and abundance information from current surveys will provide NMFS with required data to revise this outdated stock assessment. The following is a summary of aerial survey activities conducted by WDFW between March 2013 and February 2014 under this TO.

2. Methods

Aerial surveys were conducted in a Cessna 206 chartered from Rite Bros. Aviation in Port Angeles, Washington. Surveys were flown at an altitude of 600 to 800 feet (ft). Surveys were flown during low tide windows when maximum numbers of harbor seals were expected to be hauled out (Jeffries et al. 2003). For aerial surveys, the flight crew consisted of a pilot (Jeff Well, Rite Bros. Aviation in Port Angeles, Washington) in the left front, a primary observer/photographer in the right front, and a secondary observer/data recorder in the right rear.

The NAVFAC Navy Technical Representative (NTR) was provided a 7-day advance notice with specific details to be communicated with the 24-hour Command Center of the survey schedule and plans including dates, times, aircraft tail number, aircraft description, and flight crew contact information. Aerial surveys covered all haulout sites in the study region (**Figure 1**) and are described in Jeffries et al. (2000) and correspond to atlas regions 7, 8, 9, and 10. Specifically, haulout sites in Washington State were surveyed in the following atlas regions:

- Region 7: Strait of Juan de Fuca-East (east of Port Angeles to Whidbey Island), (includes Naval Magazine [NAVMAG] Indian Island)

Aerial Surveys of Pinniped Haulout Sites in Pacific Northwest Inland Waters

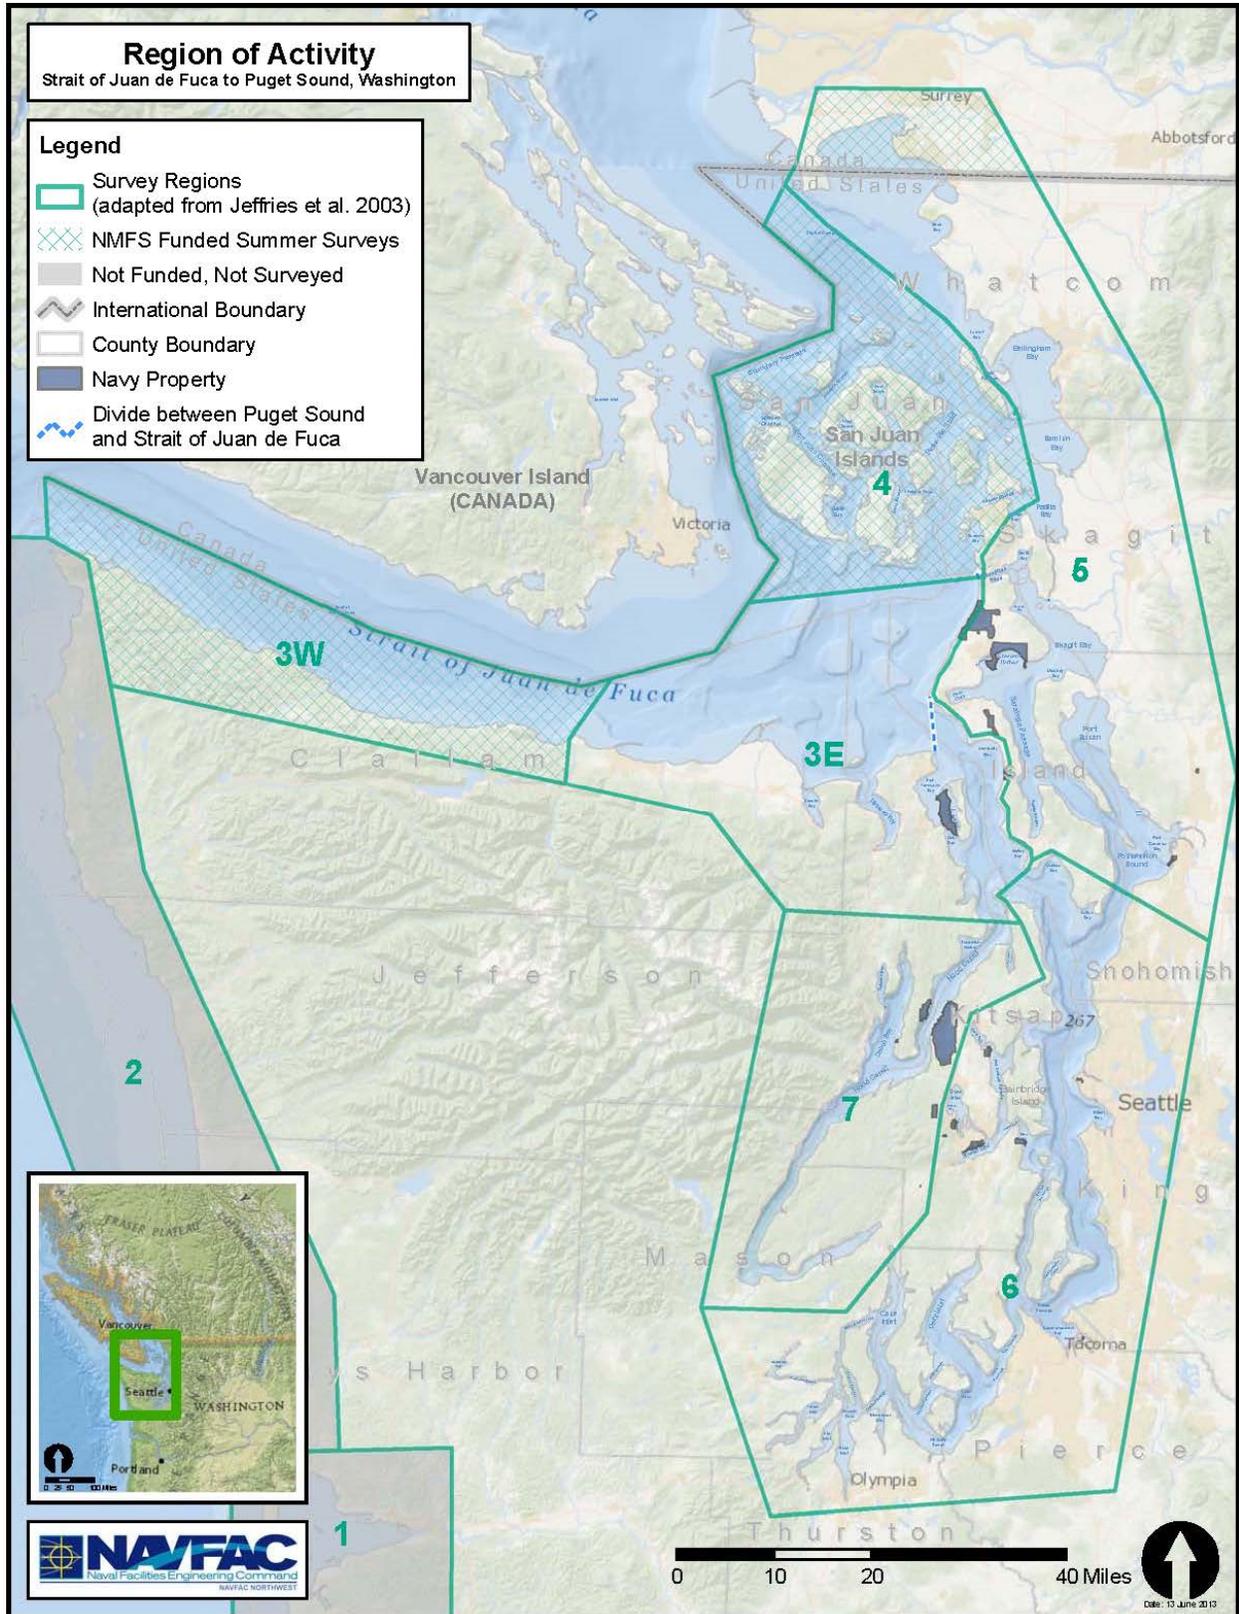

Figure 1. Survey area (adapted from Jeffries et al. 2000).

- Region 8: Hood Canal and Dabob Bay (includes Naval Base Kitsap [NBK] Bangor and vicinity)
- Region 9: Eastern Bays (from Drayton Harbor to Port Gardner) (includes Naval Station [NAVSTA] Everett and Crescent Harbor)
- Region 10: Puget Sound (Whidbey Island to Olympia) (includes Bremerton Shipyard and NBK Bremerton).

Note: The NMFS NWR has partially funded summer-only aerial surveys in U.S. waters of atlas regions including haulout areas in Region 6-Strait of Juan de Fuca-West (west of Port Angeles to Cape Flattery) and regions 11, 12 and 13 (San Juan Islands) to complete surveys needed for assessment of the Washington Inland stock of harbor seal. See **Appendix A** for a comparison of regions as defined in Jeffries et al. (2000), and regions depicted in **Figure 1**, adapted from Jeffries et al. (2003).

3. Results

WDFW conducted 24 aerial surveys of seal and sea lion haulout areas in the study area between 11 March 2013 and 19 February 2014 (**Table 1**). Surveys were conducted under National Oceanic and Atmospheric Administration (NOAA) Permit 13430. Survey dates, survey window, survey region, survey effort, number of images taken, and species recorded are listed in **Table 1**. Five other surveys were cancelled due to weather on 12 March, 20 March, 10 April, and 7 November 2013 and on 18 February 2014.

Marine mammal species recorded during aerial surveys included harbor seal, northern elephant seal (*Mirounga angustirostris*), Steller sea lion, California sea lion, gray whale (*Eschrichtius robustus*), and killer whale (*Orcinus orca*) (**Table 1; Appendices B–E**).

Harbor Seals. Harbor seals were most abundant on haulout sites during surveys conducted in July and August surveys (**Table 2; Appendix B**). Maximum counts of 9,791 seals (includes 2,398 pups) were recorded during July aerial surveys. Maximum counts of 10,328 seals (includes 2,844 pups) were recorded during August aerial surveys. These months coincide with the annual pupping and molt cycles for harbor seals in Washington inland waters and are when the highest proportion of the population is hauling out and on land. Using the pooled correction factor of 1.53 (Huber et al. 2001) for seals in the water and not countable yields estimates of 14,980 and 15,802 for July and August aerial surveys. No correction factor is available for adjusting fall, winter and spring survey counts, but aerial survey counts show a substantial decrease in the number of seals hauled indicating a large proportion of the population is not hauling out and in the water during these seasons.

Steller Sea Lions. Steller sea lions occur mainly along the outer coast of Washington from the Columbia River to Cape Flattery and move into inland waters after the summer breeding season (Jeffries et al. 2000). Both males and females are present with peak abundance recorded at haulouts at Tatoosh Island (**Figure 2**) on 25 July and 26 July with 687 and 722 Steller sea lions counted. Peak counts were recorded at Puget Sound haulouts during November aerial surveys with 44 animals counted on 6 November and 50 animals counted on 8 November (**Appendix C**).

* see **Figure 1** for depiction of survey regions

Steller sea lions haulout on port security barriers and submarines moored at Delta Pier, NBK Bangor (HDR Inc. 2012; **Figure 3**), floats in Clam Bay adjacent to Navy’s Manchester Fuel Depot (**Figure 4**), port security barrier pontoons at NBK Bremerton and NAVSTA Everett (**Figure 5**). Craven Rock east of Marrowstone Island was used consistently during fall, winter and spring aerial surveys.

California Sea Lions. Subadult and adult California sea lion males move into the study area seasonally after dispersal from their breeding rookeries. Peak California sea lion abundance occurred during November surveys (**Table 3; Appendix C**) with 345 sea lions counted on 6 November and 412 counted 8 November. Port security barrier pontoons at NBK Bremerton, floats in Clam Bay adjacent to Navy’s Manchester Fuel Depot (**Figure 4**), NAVSTA Everett (**Figure 5**), and NBK Bangor provide the primary haulout areas for California sea lions in Puget Sound. California sea lions also use submarines moored on Delta Pier at NBK Bangor as haulout areas (**Figure 3; HDR Inc. 2012**).

4. Discussion

Harbor seals are the most abundant pinniped and present year round in the study area (**Appendix B**). Maximum counts of harbor seals occurred in the study area during July and August aerial surveys (**Table 2**). The harbor seal population in inland waters of Washington was estimated at 14,980 seals in July and 15,802 in August 2013. These estimates coincide with the annual pupping and molt cycles for harbor seals in the inland waters of Washington when maximum numbers of seals are expected to be hauled out (Huber et al. 2001). During fall, winter and spring surveys, counts of seals on haulout site were substantially lower, with the majority of the harbor seal population not hauling out and in the water. The highest abundance of harbor seals at Navy facilities was recorded on logbooms adjacent to NAVSTA Everett.

Steller sea lions are present in the study area year round (**Appendix C**) with maximum counts recorded at Navy facilities (**Table 3**) during November aerial surveys when 30 and 32 Steller sea lions were hauled on floats in Clam Bay adjacent to the Navy's Manchester Fuel Depot. Only a small number of Steller sea lions (1–3 animals) were recorded using the port security barriers at NBK Bremerton and NAVSTA Everett. Craven Rock on the east side of Marrowstone Island was another haulout used consistently during aerial survey windows. No Steller sea lions were observed using the port security barriers at NAVMAG Indian Island.

California sea lions are present in the study area year round (**Appendix D**) with maximum counts recorded at Navy facilities during November aerial surveys (**Table 3**). Aerial survey counts at NBK Bremerton ranged from 2 to 169 animals, with maximum counts of 169 animals (6 November 2013) and 164 animals (8 November 2013) recorded hauled out on port security barriers. Aerial survey counts at NAVSTA Everett ranged from 3 to 131 animals, with maximum counts of 117 animals (6 November 2013) and 131 animals (8 November 2013) recorded hauled out on port security barriers. No California sea lions were observed using the port security barriers at NAVMAG Indian Island.

5. Acknowledgements

NMFS Northwest Region provided partial funding for July and August aerial surveys covering U.S. waters of the Strait of Juan de Fuca (Cape Flattery to Port Angeles) as well as the San Juan Islands. Thanks are due to Andrea Balla-Holden (Naval Facilities Engineering Command Northwest) for support and coordination of ground counts at U.S. Navy facilities and assisting with report preparation; pilot Jeff Well and Rite Bros. Aviation in Port Angeles for providing aerial survey support; Josh Oliver, Bethany Diehl and Dyanna Lambourn with WDFW for assisting with aerial surveys, counting images, data entry and data QA/QC; and Kristen Ampela (HDR) for assisting with contract management and report preparation.

APPENDIX A: COMPARISON OF REGIONS BETWEEN JEFFRIES ET AL. (2000) AND JEFFRIES ET AL. (2003)

Regions in Jeffries et al. (2000): Atlas of Seal & Sea Lion Haulout Sites in Washington	Regions in Jeffries et al. (2003): Trends & Status of Harbor Seals in Washington State
1-Columbia River	No corresponding region. Not included in Jeffries et al. 2003
2-Willapa Bay	1-Coastal Estuaries
3-Grays Harbor	
4-Olympic Coast-South	2-Olympic Coast
5-Olympic Coast-North	
6-Strait of Juan de Fuca-West	3W-Strait of Juan de Fuca-West
7-Strait of Juan de Fuca-East	3E- Strait of Juan de Fuca-East
8-Hood Canal	7-Hood Canal
9-Eastern Bays	5-Eastern Bays
10-Puget Sound	6-Puget Sound
11-San Juan Islands (Rosario Strait)	4-San Juan Islands
12-San Juan Islands (San Juan Channel)	
13-San Juan Islands (Haro Strait)	
14-British Columbia (Fraser River to Race Rocks)	No corresponding region. Not included in Jeffries et al. (2003)
